As well as rewarding you with stunning views over Uppermill and beyond, this site offers 3 short walking trails that you can follow and enjoy. The walking trails vary in difficulty and length and are signposted for you to follow.

Summit trail
A walk to the top of the quarry along the access track with the rewards of a bench, information board and breath-taking views of the surrounding countryside. Distance - 1350 metres

Woodland trail
A circular walk along the woodland edge of the quarry leading to the top of the site, descending down the stone steps to the bench and view point, and then down the access track to the quarry entrance. Distance - 1540 metres

Pond trail
A short, circular trail around the lower ponds located in the heart of the quarry. Distance - 1020 metres

Please be aware, whilst these walks might be fun and enjoyable, there are sheer rock faces, steep slopes and loose stones underfoot.

Moorgate Quarry today
Full of geology, unique nature and spectacular views, Moorgate Quarry is waiting to be discovered. The site is located in the Nilside of Wharnton Hill above Uppermill, Saddleworth. It is now home to a diverse matrix of wildlife habitats - ponds, areas of heathland, acid grassland and woodland.

History and heritage

Moorgate Quarry’s working life began in 1920’s when quarrying the Gritstone, used for road building and other purposes. Moorgate Quarry closed during the 1990’s. Oldham Council took ownership of the quarry in 1999 and undertook a restoration project to help create the important wildlife site that it has become today.

Wildlife at the quarry

When quarries come to the end of their working life they provide space for important wildlife habitats to develop as nature takes over. As part of the restoration project ponds and ditches were created and areas of heathland, acid grassland and woodland began to flourish.

Take a wander through the quarry and experience this special nature site that is now designated as a “Site of Biological Importance (SBI). There is an important population of dragonflies and damselflies that exist in and around the ponds with 15 different species having been recorded at the site in recent years.

"Site of Biological Importance (SBI) is the name given to the most important non-statutory sites for nature conservation and provides a means of protecting sites that are of local interest and importance.

In spring the quarry comes alive to the sound of bird song and the buzz of insects. Many birds find suitable nesting sites in the trees that grow along the edge of the quarry. Butterflies, bees and hoverflies can be seen flitting from flower to flower foraging for nectar and pollen, to provide them with the vital energy to enable them to survive and thrive in the quarry. By mid-summer the heather flowers cast a wonderful purple hue across the quarry.

Throughout the year a number of mammals can be found living in or visiting the quarry; from the very small, such as field voles and wood mice, to the occasional fox and roe deer.

Dragonfly or damselfly?

Damsels are tiny, dainty fliers, often multi-coloured and the size of a matchstick. They perch with their wings usually folded back along their body.

Dragonflies are larger and some are vibrant in colour and have striking body patterns when seen close up. They will perch with their wings held open at right angles to their body.

To learn more about dragonflies why not visit the British Dragonfly Society website at www.dragonflies.org.uk

If you’re lucky enough to catch sight of and photograph these beautiful animals or insects then upload it to any of our social media sites with the hashtag #LoveOldham:
